

EXTERNAL GAUGE FOR LIQUOR INVENTORY CONTROL

Abstract.

A plurality of two-dimensional template-shaped gauges to quickly determine the amount of liquor poured from a corresponding bottle. Since each style of gauge fits a complementary bottle style, the ounce, shot or metric vertical markings on the gauge can be spaced to reflect the change in bottle cross-section. A bartender or server can quickly, literally at a glance, determine the amount remaining in the bottle. The result is a more accurate pour and better control over the sales of expensive liquor and similar beverages. The new gauges are reusable an indefinite number of times depending on the plastic or other material from which they are constructed. Moreover, the new gauges are ideal for displaying brand names and logos. The template shapes may be formed on both side edges of each gauge, therefore each gauge can be used with two bottles of differing shape.
